ABSTRACTED-PUB-NO: SU 1451437A

BASIC-ABSTRACT:

The device comprises a vertical gas duct (2) connected at the bottom to a heating gas supply (1) and an auxiliary spray (8) heat exchanger (3), main spray (4) and moisture collector (5). All these are inside the gas duct, one under the other. The moisture collector is connected to the main spray to form a closed circuit (6), and to the auxiliary spray via the heating side of a surface heat exchanger (11) to form another circuit (9). The heated side of the heat exchanger (11) is in parallel with the first heat exchanger (3).

The device also includes a two-stage contact heat exchanger (13) included in the water system between the top-up tube (7) and the circuit (6); and in the gas system, between the first stage (14) as the water flows, after the vertical gas duct, and the second stage (15), in parallel with the sector of it containing the spray. The preheating of the top-up water is supplied to the spray sends more heat to the first heat exchanger and reduces the exhaust gas temp.

ADVANTAGE - The device makes fuller use of the exhaust gas heat. Bu.2/15.1.89

ABSTRACTED-PUB-NO: SU 1590863A

BASIC-ABSTRACT:

The plant comprises an inflow air duct (1) with fan (2), heat exchanger (3) and spray chamber (4) with sprays (5) and sump (6), connected by an outlet (7) to atmosphere, and a draught air duct (8) with fan (9) and auxiliary spray chamber (10) with sprays (11) and sump (12). The heat pump is in the form of an evaporator (13), compressor (14), condenser (15) in a through-flow cavity (16), and an adjustable valve (17).

The sump of the auxiliary chamber is connected via the condenser flow cavity by switchable elements (19-25) to the heat exchanger and sprays of the main spray chamber in parallel. The sprays and sump of the auxiliary chamber can be cut out. The main spray chamber has a bypass channel (29). It is connected by an outlet (7) to the outlet of the inflow air duct by an adjustable flap (30), and is in the inflow air duct after the heat exchanger as the air flows.

ADVANTAGE - Is more versatile, makes more use of draught air heat. Bul. 33/7.9.90
